

RegExps & DFAs

CS 536

Pre-class warm up

Write the regexp for Fortran real literals

An optional sign ('+' or '-')

An integer or:

1 or more digits followed by a '.' followed by 0 or more digits

or: A '.' followed by one or more digits

$('+' | '-' | \epsilon)(\text{digit}^+ ('.' | \epsilon) | (\text{digit}^* '.' \text{digit}^+))$

Last time

Explored NFAs

for every NFA there is an equivalent DFA

epsilon edges add no expressive power

Introduce regular languages / expressions

Today

Convert regexps to DFAS

From language recognizers to tokenizers

Regex to NFAs

Literals/epsilon correspond to simple DFAs

Operators correspond to methods of joining DFAS

x^n , where n is even **or** divisible by 3

Regex to NFA rules

Rules for operands

Regex to NFA rules

Rules for alternation $A|B$

Make new start state q' and new final state f'

Make original final states non-final

Add to δ :

$q', \epsilon \rightarrow q_A$

$q', \epsilon \rightarrow q_B$

$f_A, \epsilon \rightarrow f'$

$f_B, \epsilon \rightarrow f'$

Regex to NFA rules

Rule for catenation

Make new start state q' and new final state f'

Make original final states non-final

Add to δ :

$q', \epsilon \rightarrow q_A$

$f_A, \epsilon \rightarrow q_B$

$f_B, \epsilon \rightarrow f'$

Regex to NFA rules

Rule for catenation

Make new start state q' and new final state f'

Make original final states non-final

Add to δ :

$q', \epsilon \rightarrow q_A$

$q', \epsilon \rightarrow f'$

$f', \epsilon \rightarrow q_A$

Regex operator precedence

Operator	Precedence	Analogous math operator
	low	addition
.	medium	multiplication
*	high	exponentiation

Tree representation of a regexp

$(letter \mid \text{'_'})(letter \mid \text{'_'} \mid digit)^*$

Operator	Precedence
----------	------------

	low
.	medium
*	high

Bottom-up conversion

Bottom-up conversion

Bottom-up conversion

Bottom-up conversion

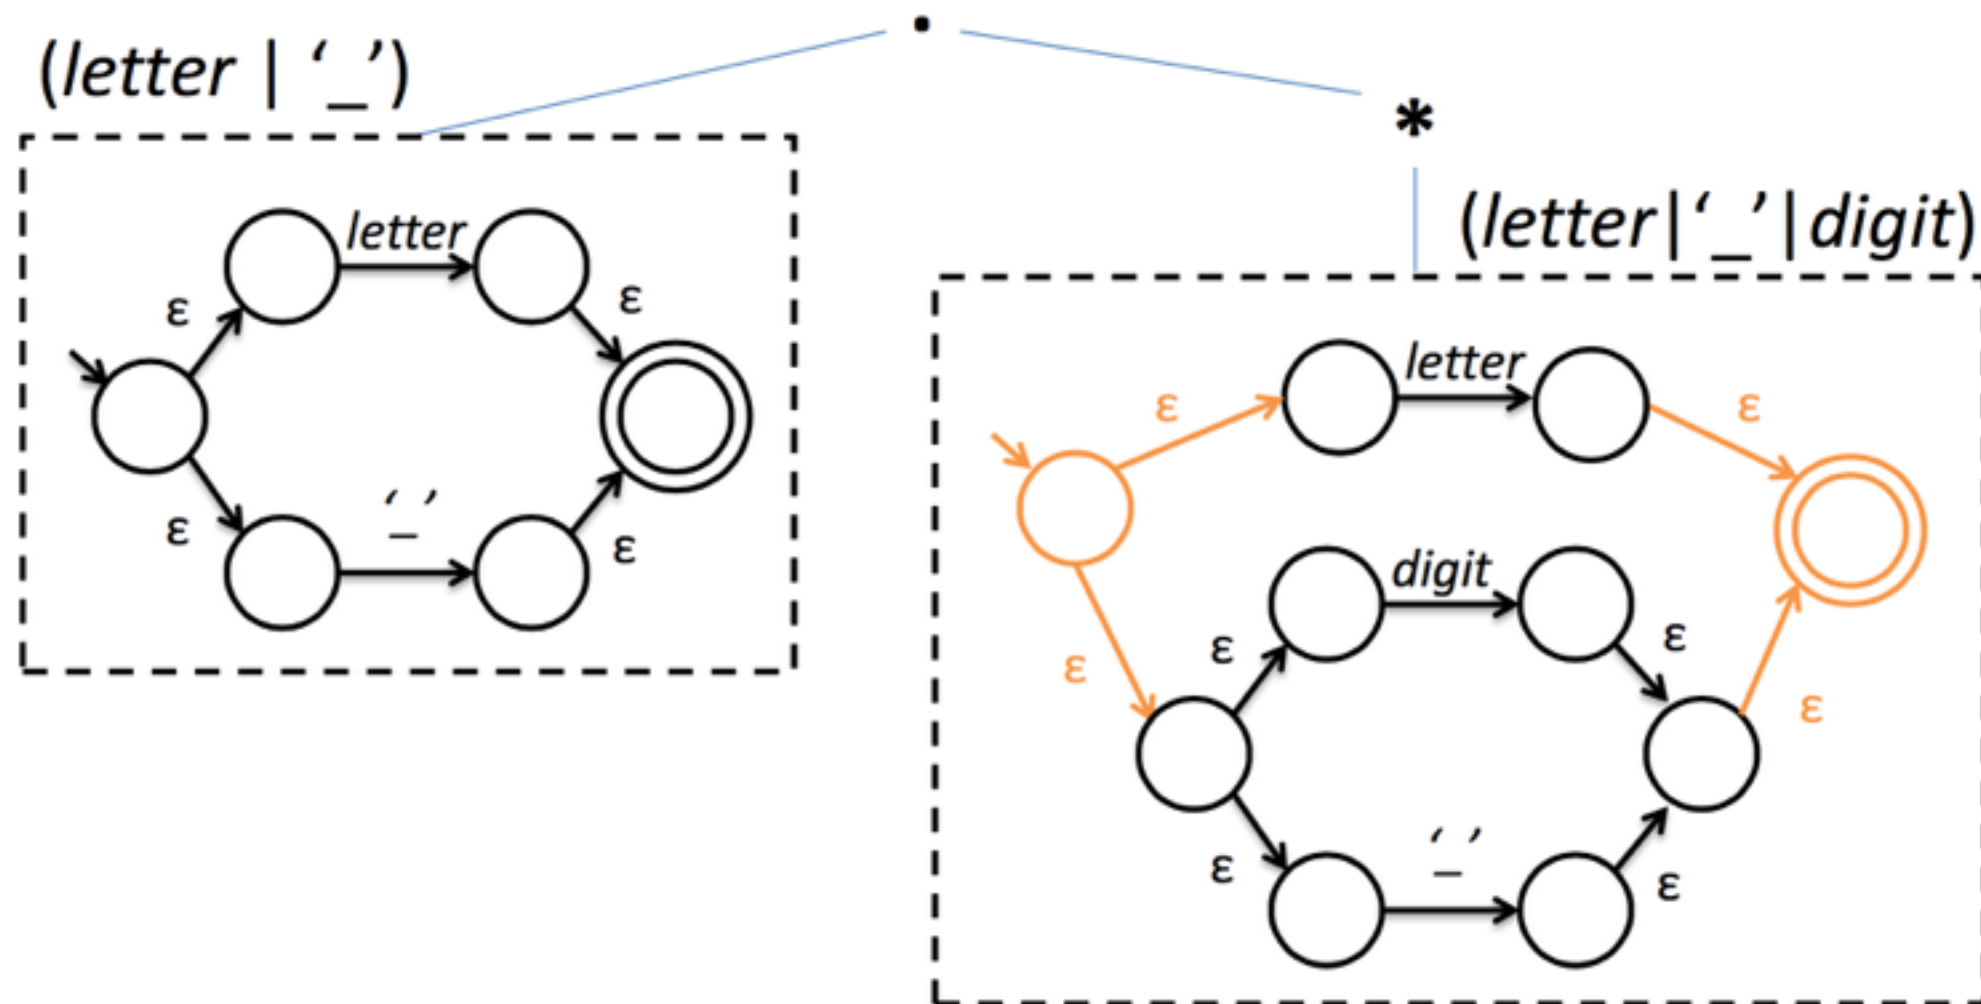

Bottom-up conversion

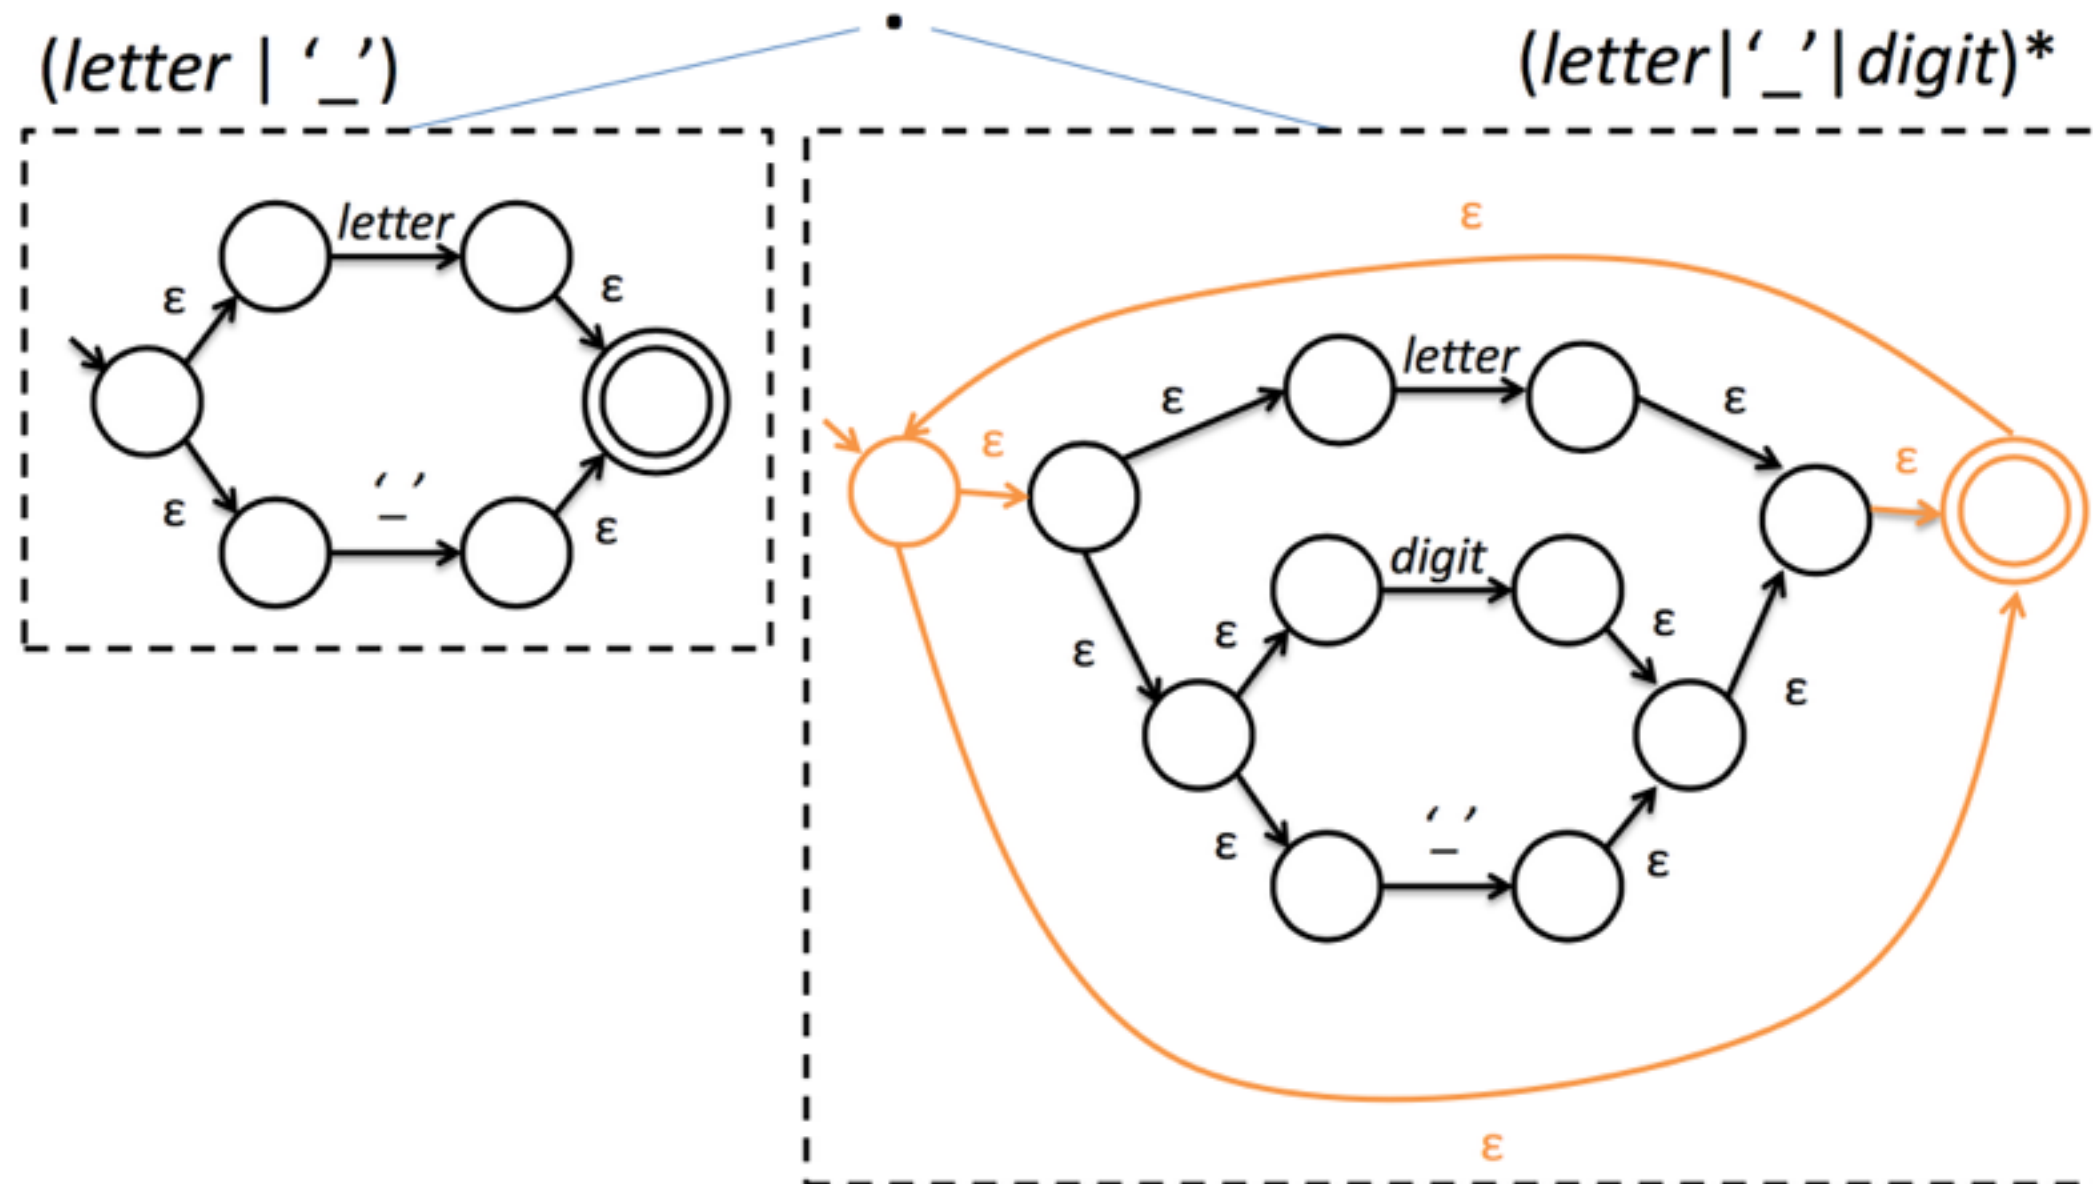

Bottom-up conversion

Bottom-up conversion

Bottom-up conversion

Bottom-up conversion

$(letter \mid ' _ ')(letter \mid ' _ ' \mid digit)^*$

Regex to DFAs

We now have an NFA

We need to go to DFA

But what's so great about DFAs?

Table-driven DFAs

Recall that δ can be expressed as a table

This leads to a very efficient array representation

	a	b	c
s ₁	s ₂	s ₂	
s ₂	s ₁		s ₂

```
s = start state
while (more input){
    c = read char
    s = table[s][c]
}
if s is final, accept
```

FSMs for tokenization

FSMs only check for language membership of a string

- the scanner needs to recognize a stream of many different tokens using the longest match

- the scanner needs to know what was matched

Idea: imbue states with actions that will fire when state is reached

A first cut at actions

Consider the language of Pascal identifiers

State	Actions
s_2	return ID

BAD: not longest match

Accounting for longest matches

State	Actions
s_3	return ID

BAD: maybe we needed that
NOT letter,digit character

A second take at actions

Give our FSMs ability to put chars back

State	Actions
s ₃	Put 1 char back, return ID

Since we're allowing our FSM to peek at characters past the end of a valid token, it's also convenient to add an EOF symbol

Our first scanner

Consider a language with two statements

assignments: `ID = expr`

increments: `ID += expr`

where **expr** is of the form

`ID + ID`

`ID ^ ID`

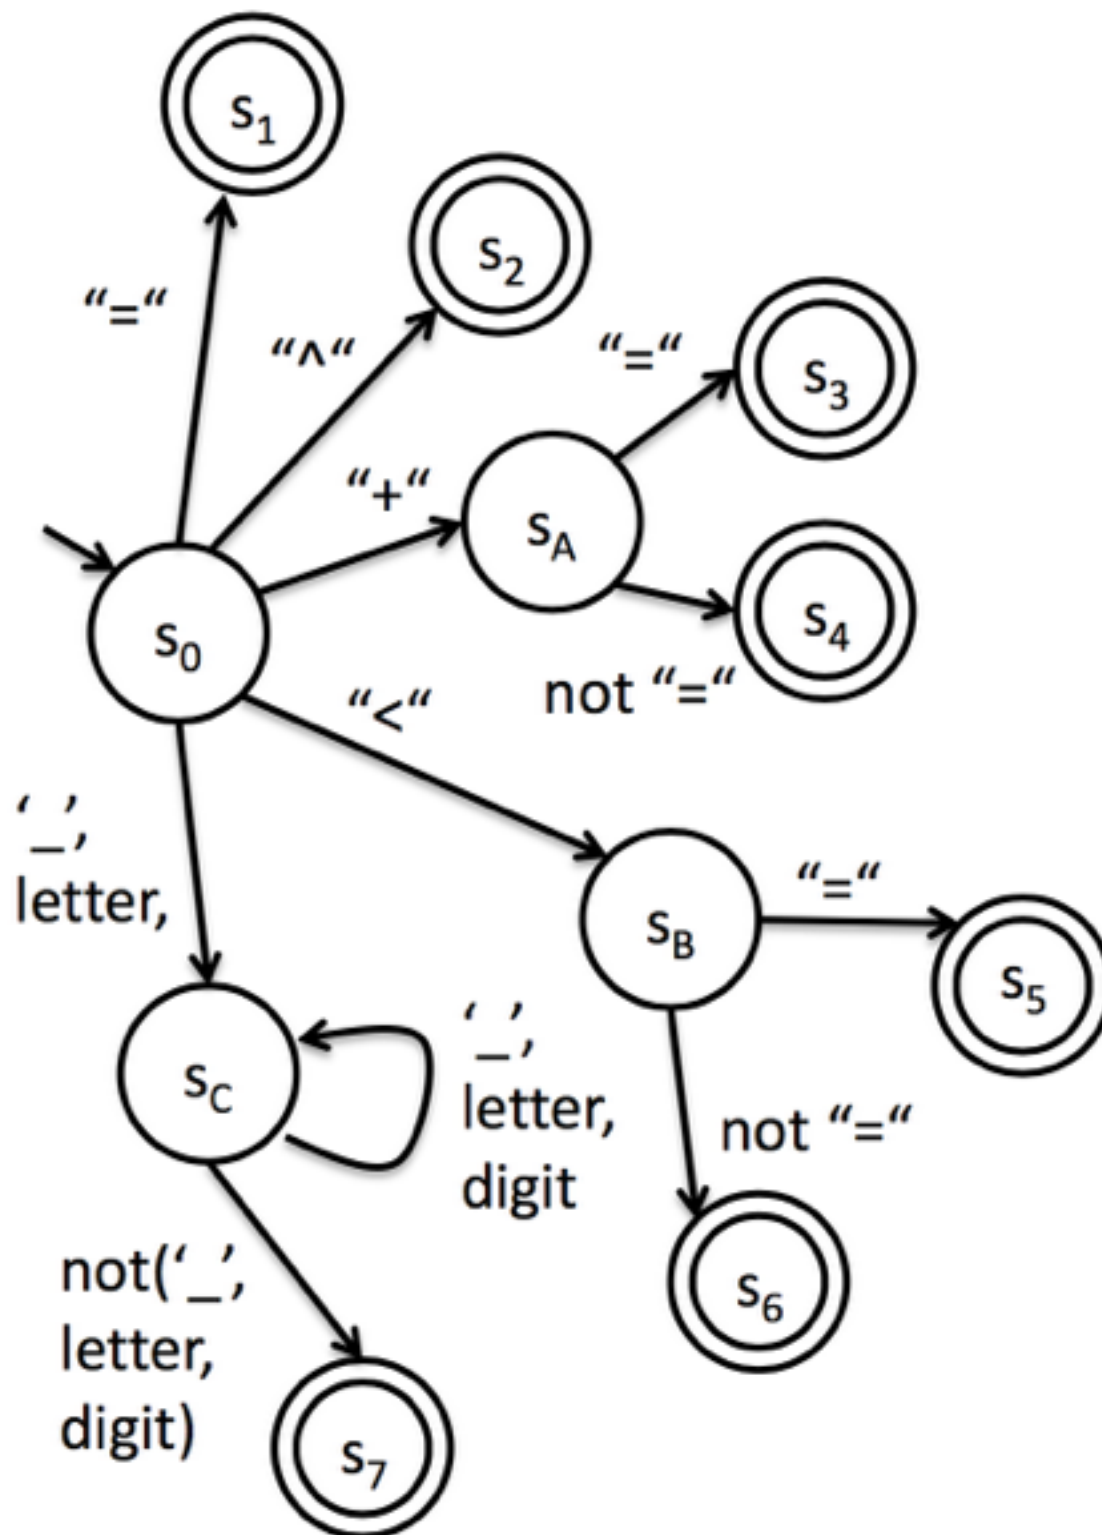

`ID < ID`

`ID <= ID`

Token name	Regular Expression
ASSIGN	"="
INC	"+="
PLUS	"+"
EXP	"^"
LT	"<"
LEQ	"<="
ID	<i>(letter _)(letter digit _)*</i>

Identifiers ID follow C conventions

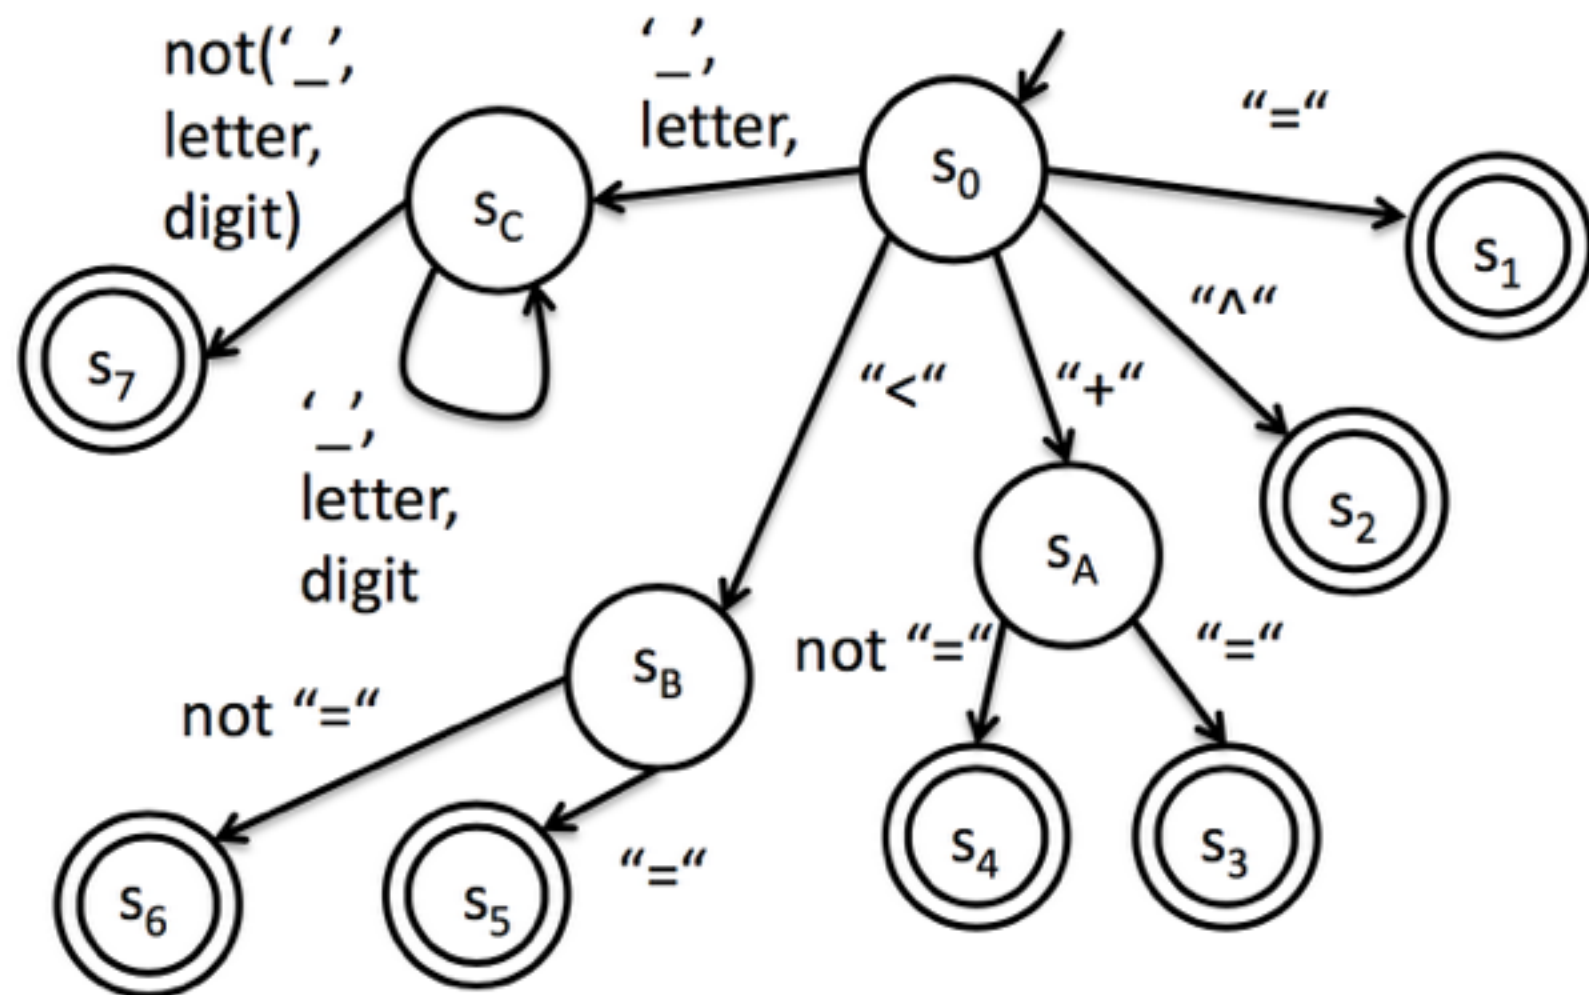

Combined DFA

Token name	Regular Expression
ASSIGN	"=
INC	"+=
PLUS	"+"
EXP	"^"
LT	"<"
LEQ	"<="
ID	<i>(letter _)(letter digit _)*</i>

State	Action
S1	return ASSIGN
S2	return EXP
S3	return INC
S4	put back 1 char, return PLUS
S5	Return LEQ
S6	put back 1 char, return LT
S7	put back 1 char, return ID

	=	+	^	<	_	letter	digit	EOF	none
S ₀	Ret ASSIGN	S _A	Ret EXP	B	C	C		Ret EOF	
S _A	Ret INC	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS
S _B	Ret LEQ	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT
S _C	Back 1, Ret ID	Back 1 Ret ID	Back 1, Ret ID	Back 1, Ret ID	S _C	S _C	S _C	Back 1, Ret ID	Back 1, Ret ID

	=	+	^	<	_	letter	digit	EOF	none
S_0	Ret ASSIGN	S_A	Ret EXP	B	C	C		Ret EOF	
S_A	Ret INC	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS	Back 1, Ret PLUS
S_B	Ret LEQ	Back 1, Ret LT	Back1, Ret LT	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT	Back 1, Ret LT
S_C	Back 1, Ret ID	Back 1 Ret ID	Back 1, Ret ID	Back 1, Ret ID	S_C	S_C	S_C	Back 1, Ret ID	Back 1, Ret ID

```

do{
    read char
    perform action / update state
    if (action was to return a token){
        start again in start state
    }
} (while not EOF or stuck);

```

Lexical analyzer generators

aka scanner generators

The transformation from regexp to scanner is formally defined

Can write tools to synthesize a lecture automatically

Lex: unix scanner generator

Flex: fast lex

JLex: Java version of Lex

JLex

Declarative specification

tell it what you want scanned, it will figure out the rest

Input: set of regexps + associated actions

`xyz.jlex` file

Output: Java source code for a scanner

`xyz.jlex.java` source code of scanner

jlex format

3 sections separated by %%

user code section

directives

regular expressions + actions

//User Code Section (uninterpreted java code)

%%

//Directives Section

DIGIT = [0-9]
LETTER = [a-zA-Z]
WHITESPACE = [\040\t\n] } Macro definitions

%state SPECIALINTSTATE — State declaration

//Configure for use with java CUP (Parser generator)

%implements java_cup.runtime.Scanner

%function next_token

%type java_cup.runtime.Symbol

//End of file behavior

%eofval{

System.out.println("All done");

return null;

%eofval}

//Turn on line counting

%line

%%

//Regular Expression rules

Rules section

Format is `<regex>{code}` where `regex` is a regular expression for a single token

can use macros from the directive sections in `regex`, surround with curly braces

Conventions

chars represent themselves (except special characters)

chars inside “” represent themselves (except \)

Regex operators

| * + ? () .

Character class operators

- range

^ not

\ escape

jflex rules example

```
"="      { System.out.println(yyline + 1 + ": ASSIGN"); }
"+"      { System.out.println(yyline + 1 + ": PLUS"); }
"^"      { System.out.println(yyline + 1 + ": EXP"); }
"<"      { System.out.println(yyline + 1 + ": LT"); }
"+="     { System.out.println(yyline + 1 + ": INC"); }
"<="     { System.out.println(yyline + 1 + ": LEQ"); }
{WHITESPACE} { }
({LETTER}|"_")({DIGIT}|{LETTER}|"_")* {
    System.out.println(yyline+1 + ": ID " + yytext());}
.      { System.out.println(yyline + 1 + ": badchar"); }
```
